

From the Remote Region of Coastal British Columbia

Our unique and rare deposits of glacial marine clay are unlike any other as they are located beneath a live and active glacier, rather than in an area where glaciers existed tens of thousands of years ago. Over time, the erosion and glacial run off carry vast deposits of precious minerals down river to settle in the estuaries along the Coastal Region of British Columbia. Throughout the journey the minerals are energized through the process of hydrolysis which creates a negative electrical charge. It is this negative charge along with the essential nutrients that gives this particular clay its powerful natural healing properties.

Hand Harvested, Solar Dried & Powdered

Versatility

There are a vast assortment of common and unconventional uses for our glacial marine clay and more benefits and uses are reported every day. Our clay is in its purest form with nothing added and without harsh processing procedures. The clay is hand harvested, solar dried, and powdered. It is very important to us to keep our practice as environmentally responsible as possible. With the techniques that we use to produce our clay, we are a popular choice with natural skin and healthcare companies, soap-makers and researchers.

We process our clay to a particle size similar to that of plant pollen, allowing it to deeply penetrate the pores of your skin. This particle size allows for skin product formulations that include foundations, bb creams, mineral makeup, lip gloss, facial masks, antiperspirants, toners, moisturizers, and cleansers, to name a few. Spa applications include facial masks, body wraps, body and foot scrubs, mineral baths etc.

A Superior Product

Glacial marine clay can only be a superior product if the region of erosion can supply large amounts of minerals and elements that are required for good health and well being. Glacial Bay Organic Clay's deposits have large amounts of these key ingredients making it one of the purest and most highly enriched clays available on the market today.

Our glacial marine clay deposits are inter-tidal and submerged in clean Pacific Ocean seawater 50% of the time. They are refreshed with micro-nutrients from marine phytoplankton on a daily basis which has been proven to be very beneficial for skin and body care. Test results show that our clay has a neutral pH balance which is desirable for many different applications. Also, it has been proven through Certificates of Analyses (lab reports) that our clay possesses remarkably high levels of beneficial minerals in conjunction with low heavy metals, the combination of which is ideal for skin and hair product formulations, detoxifications and chelation, and many other skin and body care uses.

"I am a Naturopath who specializes in detoxing and have recently started using Glacial Bay Clay instead of Bentonite clay in my daily practice. The results have been beyond incredible! The quality and purity of the product is far beyond anything else on the market. I have used the clay externally as a skin paste and internally as an additive when I administer colonics. I find it chelates toxins and heavy metals quickly and easily without any adverse side effects." Don Ward, InnerGlow Wellness Centre, Nanaimo, B.C.
