

MANUFACTURING PROCESS:

PS3

Extraction

The extraction is always done in winter period. Marine mud is extracted from beneath a thick layer of peat moss which protects the mud from environmental contaminant exposition. The peat moss layer is replaced once the extraction has been made to preserve the deposit.

Sterilzation

The marine clay powder is sterilized by autoclave (121 Celsius) to keep a maximum of organic elements.

Conditioning & Packing

The marine clay powder is packaged in a clean room and stored for delivery.
